RV2-10 - Relief valve

Poppet, pilot operated with reverse flow check
12-114 L/min (3-30 USgpm) • 350 bar (5000 psi)

Operation

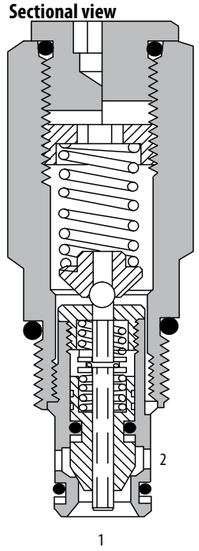

When the inlet reaches the valve setting, the pilot section opens, causing a small flow across the orifice in the poppet.

The subsequent pressure drop moves the poppet, opening the valve, allowing relief flow to tank.

Features

Very low pressure rise for any increase in flow giving accurate pressure control. Hardened working parts give long, reliable, trouble-free life. Cartridge construction giving maximum flexibility in mounting.
